

# What is Spear Phishing?

A spear phishing focuses on **the quality of the attack**. Hackers research information about a person they want to target.

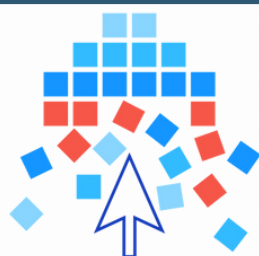

The hackers send a **personalised email with malicious links** to make the target believe it's from a legitimate sender.

Once the **target clicks on the link**, the hackers ask for information to gain access to the victim's sensitive data

Cybercriminals use the stolen information to **perform fraudulent and malicious acts**
